Exit and save Local Data

Type a school name or other tagline text here

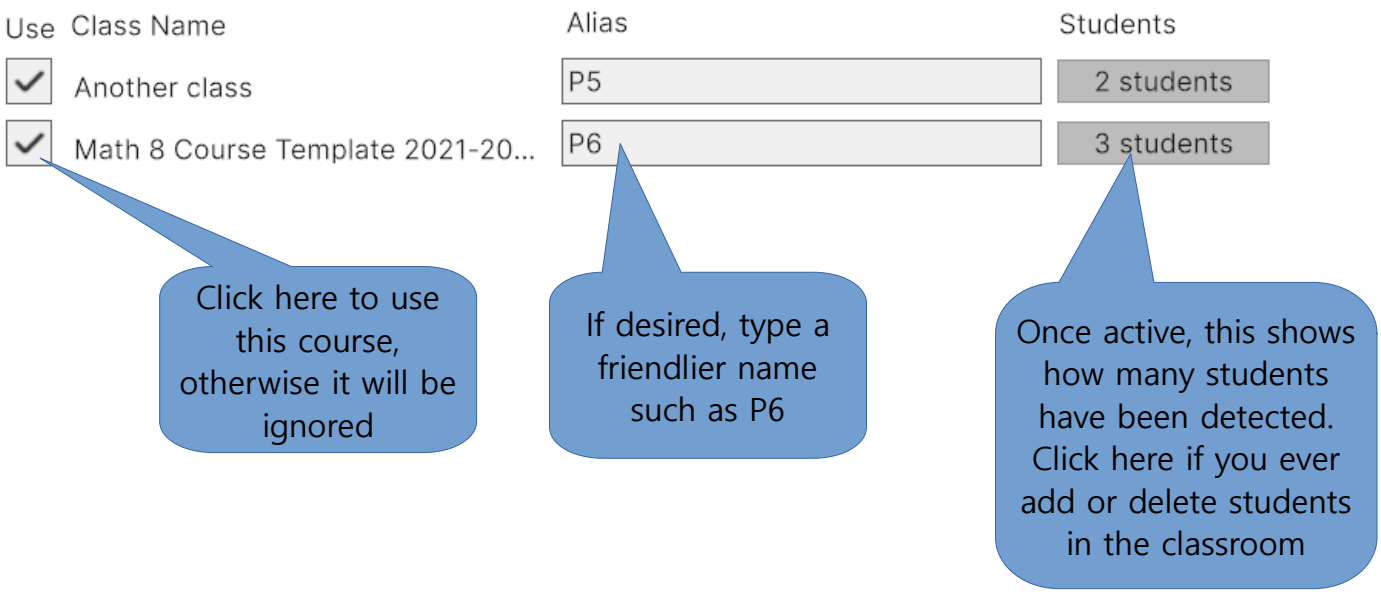
Choose a watermark for the floor of the stadium. Use a PNG with alpha transparency

Click here to sign in to Google to read the classes you have

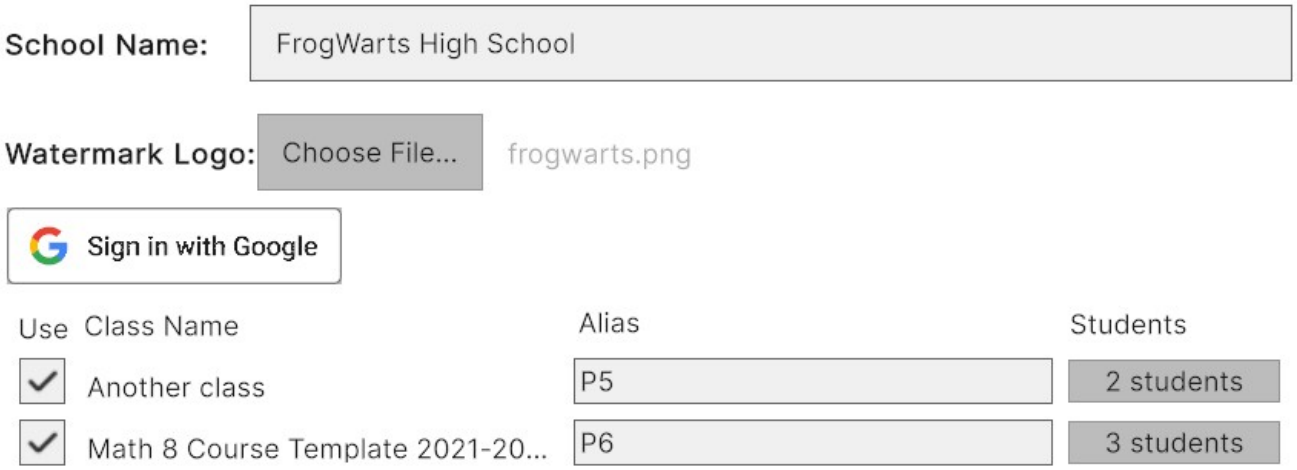
A list of classes stored by Google Classroom will appear here

Signing in with Google

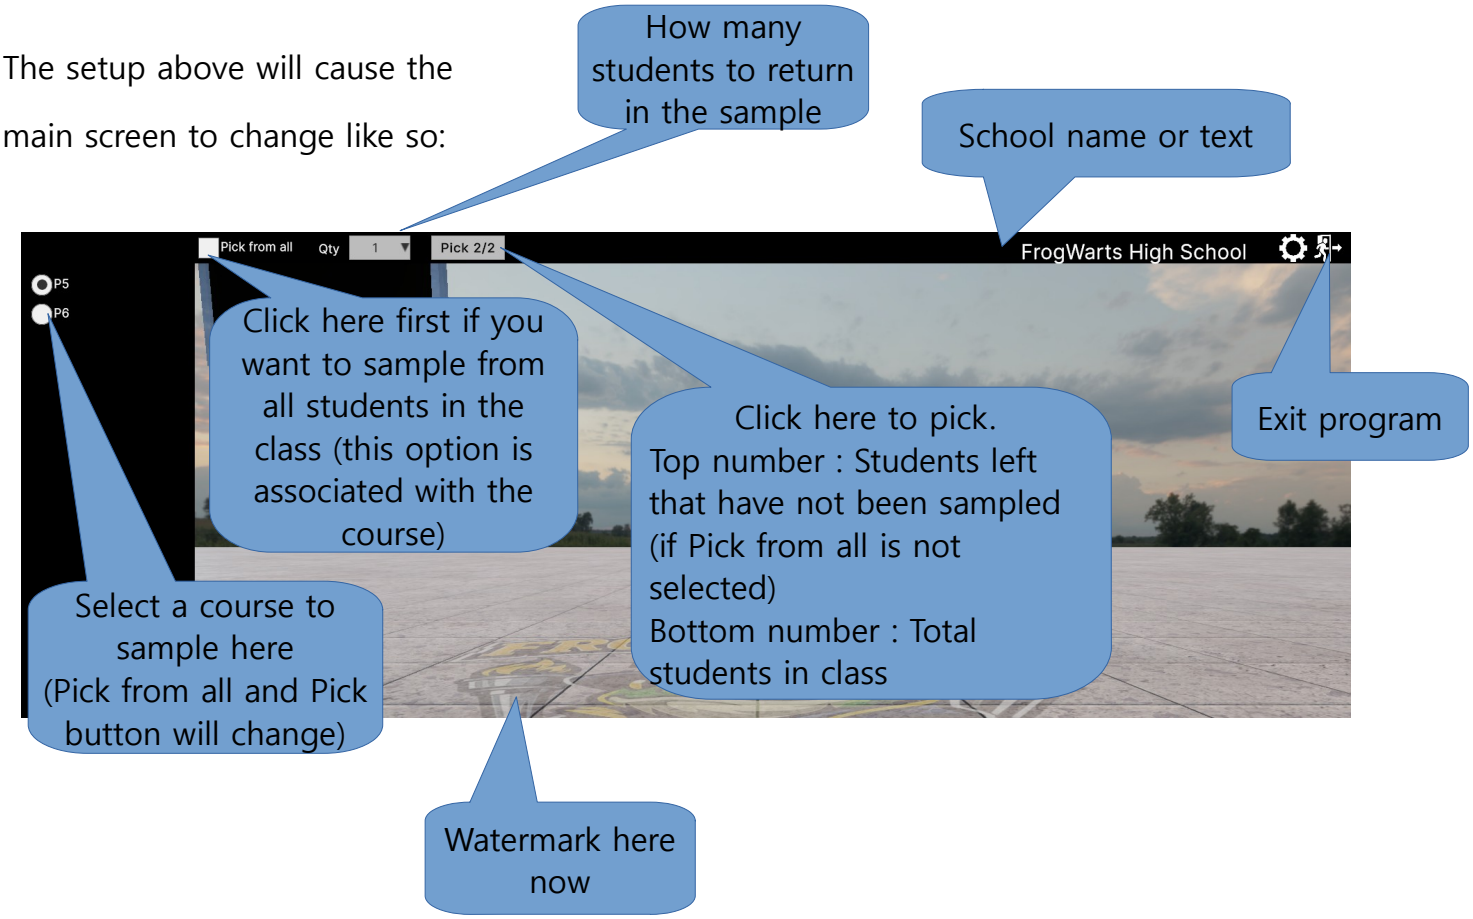
The detected classes will be automatically shown:



Example Setup



The setup above will cause the main screen to change like so:



Notes

Picking

Pressing pick will create a named token for each student. Once they drop randomly, a student will be picked and displayed.

'Pick from all' selected prior to picking: A group (1-5) of students are picked from all students.

'Pick from all' not selected: A group (1-5) of students are picked from the remaining students that have not been picked. The picked students are removed from the picking set.

During setup, new student names will be saved but picked students will be forgotten. If you want to preserve those who have been picked, wait until the pick button says 1/32 (for example) and then redo the setup **after** the next pick.

Memory Based Google Sign-in

Snappix does not save your Google login between sessions. When you restart the program and go back into Setup, you'll be asked to pick your Google account again. Classroom Active and Alias settings are saved only when the **same** Google user logs in during setup. If a different Google account is used, those settings are removed.

Adding Students

If students are added to an existing Google classroom, then setup will need to be performed again. Clicking the refresh button (to the right of the class) is not necessary unless students have been added to the classroom during Snappix setup.

Data Saved per User

This application stores all data on a per-Windows-user basis. Each Windows account has its own isolated data folder, so settings, courses, and student lists are not shared between users. The application cannot access or detect data belonging to other Windows accounts.

Local Storage

When classes are selected in the setup screen, students are read from Google Classroom and the names are encrypted and stored locally. Local files are typically found in C:/Users/USER_NAME/AppData/LocalLow/PhotonicWorlds/Snappix.

Privacy / Data Storage

- The data in Google Classroom is never changed – it is read only.
- No remote transactions occur except for those that read data from Google and sign in to Google using OAuth.
- The student/class data is kept in encrypted local storage.
- Google Classroom is only accessed during the setup screen.
- Donating is strictly voluntary via BuyMeACoffee.
